SOLUTION TO NAND BAD FLASH OF XBOX 360

IMPORTANT:

Follow precisely the instructions below, a minimum error or the premature cancellation of NAND will result in a console UNUSABLE.

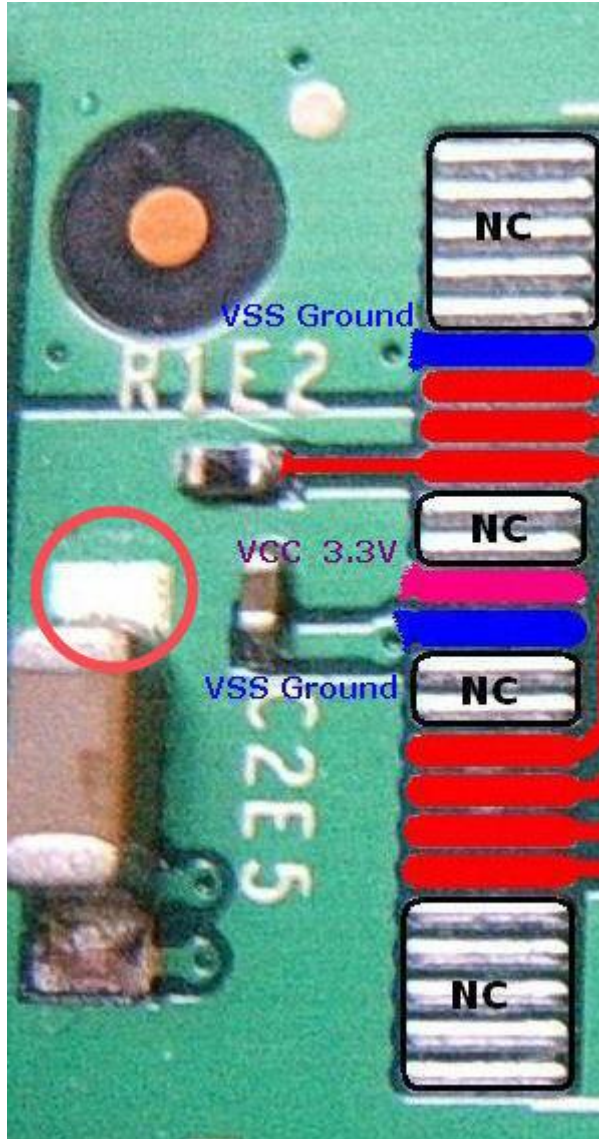

The following procedure will VOID COMPLETELY your WARRANTY

When there is a bad flash the console death , because will be pulled over the point : D1,D3 ,D5 and D7 powered at 3.3V , this prevents at INFECTUS to detect the NAND for reading and writing up

Connect the point 5V and GND of the Infectus at external feeder with +5V and GND (Use Xeno Connectivity Kit or another feeder from PC) for isolate the chip from the motherboard

Connect the circular point 3.3V how is illustrated in this photo at one external feeder at 3.3V (Use Xeno Connectivity Kit or another feeder from PC) and not connect the feeder of XBOX360 at motherboard!

Turn on your external feeder for give the current at INFECTUS and NAND and later connect the USB CABLE. The infectus see the flash and so you can write a new valid firmware on the NAND for use it

Repeat this steps when there is a bad flash. One you have a valid firmware remove the cable 3.3v , 5V ,GND and installing everything how you can see in this picture.
